Framework Reference: The Open Group Architecture Framework (TOGAF), 10th Edition

Section 1: Enterprise Boundary & Problem Authenticity

- **Enterprise Scope & Landscape Baseline**: FH Innovations Inc. (FHI) operates as an automotive services MSME with approximately 27 employees, located at FHI headquarters and operational touchpoints across Metro Manila automotive service centers, including partner dealership service bays like Toyota Balintawak and Toyota Manila Bay. The current baseline IT estate is entirely manual, utilizing index cards and fragmented spreadsheets with no dedicated IT infrastructure or personnel.
- **Business Catalyst**: The primary business driver is severe operational friction and working-capital compression caused by unverified manual processes, inventory gaps, and delayed collections.
- **Primary Operational Failure Modes**: Current operations suffer from four main breakdown points: a lack of reconciliation between items purchased and items delivered to dealer consignments; recurring stockouts driven by supplier distance; unsystematic Accounts Receivable aging across multiple disconnected bank accounts; and manual, unverified pre-numbered Job Orders that cause human error and untraceable cancellations.

Section 2: Organizational Model for EA

- **Scope of Organizations Impacted & Governance Structure**: The architecture impacts FHI corporate administration, finance, and field service operations, alongside touchpoints with external partner dealership service bays. Governance is led by Executive Sponsors Harry Ho (President) and Ms. Lisa (Administrator / Business Partner).
- **Stakeholder Power/Interest Alignment & RACI Matrix**:

Stakeholder	Phase A	Phase B	Phase C	Phase D	Phase E/F
Harry Ho (President)	A	A	C	C	A
Ms. Lisa (Administrator / Business Partner)	R	R	R	C	R
FHI Service Staff	C	R	R	R	C

- **Framework Interface Assessment**: The architecture interfaces directly with FHI's monthly financial closing and billing reconciliation cycle managed by Ms. Lisa, with transition milestones phased to avoid disrupting daily operations at partner dealership bays.

Section 3: Tailored Architecture Framework

- **Metamodel Tailoring Logic**: FHI tailored the standard TOGAF Foundation Metamodel to fit a flat, 27-person MSME by retaining entities including Business Actor, Business Role, Business Service, Business Process, Business Event, Data Object, Application Component, Application Service, Physical Technology Component, and System Software, while deleting enterprise-grade constructs like Logical Technology Component, Technology Service, external SLAs, and broad Location or Organization Unit hierarchies.
- **Committed Architecture Deliverables**: The team committed to producing the Business Capability Map, Process Flow Diagram (As-Is vs. To-Be), Actor-to-Role Matrix, Data Entity/Data Flow Diagram, Application Communication Diagram, Information Use-Case Matrix, Technology Infrastructure Catalog, and a Network & Data Topology Diagram across ADM Phases A through D.

Section 4: Collaborative Foundations & Evidence

- **Principles Catalog**:
    - **Principle 1 (Digital-First Over Manual Tracking)**: Mandates that all business transactions, inventory movements, job orders, and billing metrics be recorded digitally at the point of origin to eliminate human error and visibility gaps.
    - **Principle 2 (Three-Way Consignment Reconciliation)**: Requires verifiable traceability across Purchase Orders, Delivery Receipts, and actual Jobs Done before billing generation to prevent inventory shrinkage.
    - **Principle 3 (Automated Accounts Receivable Aging)**: Requires financial workflows to systematically track invoice collection windows and aging brackets through automated alerts.
- **Primary Data Sources & Baseline Metrics**: The architecture addresses an enterprise with approximately 27 employees, operating across partner dealership bays such as Toyota Balintawak and Toyota Manila Bay, running entirely on manual index cards and fragmented spreadsheets.

Section 5: Evaluator Verification Rubric Summary

- **Enterprise Scope**: Clearly named enterprise (FH Innovations Inc.) with an explicit headcount (~27 staff), specific site contexts (headquarters and Metro Manila dealership bays), and named baseline tools (index cards and fragmented spreadsheets).
- **Business Catalyst**: Rooted in concrete operational friction (working-capital compression, stockouts, uncollected balances) rather than vague desires.
- **Metamodel Tailoring**: Explicitly pruned enterprise-grade constructs to match a flat MSME structure while retaining essential business and technology entities.
- **Architecture Principles**: Defined using the standard structure with actionable trade-offs addressing digital tracking, 3-way reconciliation, and automated AR aging.
